

*... for hygienic*

# **BLANKET WASHING** *in Hospitals*

Infection from bedclothes has always been an item of concern in Hospitals. Until recently the most satisfactory method was to wash the blankets in a suitable detergent, rinse and then treat with a cation-active germicide. The action of cleaning and disinfection can now be carried out *simultaneously* by using the new detergent/sterilizer Hytox, which is effective against a wide range of Gram positive and Gram negative organisms.

# **HYTOX**

**THE COMBINED  
DETERGENT/STERILIZER**

**Extract from  
letter to  
'THE LANCET' 11.10.58**

*.... Hytox has now been tried at one of our Hospitals with great success. The blankets emerge very white, soft and clean and the fibres have anti-bacterial properties and are sterile. Hytox is also inactivated by traces of ordinary washing soap in the blanket or in the crevices of the washing machine; so the first time a used blanket is washed the results may be disappointing. However, the second time the blankets are washed in a clean machine the results are very satisfactory.*
