**Introduction** Homocysteine has been implicated in promoting atherosclerotic vascular disease. We have already demonstrated that high level of plasma homocysteine is an independent correlate for increased carotid artery wall thickness in cross-sectional study in a same cohort. The present study was designed to determine whether high plasma homocysteine levels predict the development of hypertension after ten years.

**Methods** A periodic epidemiological survey was performed in 1999 in Tanushimaru town. Data on fasting homocysteine were obtained from 1111 individuals (452 males, 659 females) in 1999. 512 subjects who were BP<140/90 mm Hg or taking hypertensive medication were excluded from the study. We enrolled 599 individuals at baseline. Ten years later, we conducted follow-up health examination in the same cohort. Of the 599 subjects, 50 had died, 49 had refused the examination. Consequently, 500 subjects (326 males, 174 females) were re-examined.

**Results** Of 500 normotensives (BP<140/90 mm Hg) without anti-hypertensive medications) at baseline, 230 subjects (46%) developed hypertension. We divided the baseline plasma homocysteine levels into tertiles. The OR for the development of hypertension after ten years was 1.66 (95% CI 1.02 to 2.73) in the highest tertile vs the lowest tertile of homocysteine level after adjustment for confounding factors.

**Conclusion** High levels of homocysteine predicted the development of hypertension in normotensive subjects. We may propose measurement of plasma homocysteine as a predictive marker for hypertension in clinical practice.

**P2-91** CALCIUM, PHOSPHORUS, AND CARBOHYDRATES AND THE RISK OF COLORECTAL CANCER IN POLAND
doi:10.1136/jech.2011.142976i.26

**Introduction** An increasing trends of colorectal (CRC) morbidity and mortality across developed countries is observed. Epidemiological studies showed that majority of those cases are due to improper diet. The results on colorectal risk modification by dietary factors in central Europe are scarce. The objective of the present study was to evaluate the role of calcium, phosphorus and polysaccharides intake on colorectal cancer risk in Poland.

**Methods** The hospital-based case-control study was carried out in Poland in 2000–2010. In total, 637 histologically confirmed cancer cases and 874 controls were recruited. Information about frequency of consumption of 148 alimentary items and numerous confounders was gathered by questionnaire.

**Results** After adjustment, increase consumption of calcium was associated with decreased risk of colorectal cancer (OR=0.59, 95% CI 0.41 to 0.86). Similar change in risk was observed with increased consumption of phosphorus (OR=0.58, 95% CI 0.44 to 0.75). On the other hand, an increasing risk of CRC with increasing consumption of polysaccharides was observed (in quartiles: ORs: 1.20, 1.39, 1.56, respectively).

**Conclusions** The results of the present study support the protective role of high intake of calcium and phosphorus in the aetiology of colorectal cancer. Additionally they suggest that high consumption of polysaccharides may lead to elevated risk of CRC.

**P2-92** MORTALITY FROM CHRONIC DISEASES IN BRAZIL, 1980–2008
doi:10.1136/jech.2011.142976i.28

L Garcia,* 3M Montenegro, 3W Ramalho. 1Institute for Applied Economic Research - IPEA, Brasilia, Brazil; 2Brazilian Ministry of Health, Brasilia, Brazil; 3University of Brasilia, Brasilia, Brazil

**Introduction** The profile of causes of death in Brazil has changed in recent decades. The objective is to describe the evolution of mortality from chronic diseases in Brazil, 1980–2008.

**Methods** Crude and age- and sex-standardised mortality rates (SMR) and proportional mortality ratios (PMR) were calculated from data from the Mortality Information System of the Ministry of Health.

**Results** In the period of 1980–2008, diseases of the circulatory system were the main cause of death (PMR=52.1% in 1980, 51.8% in 2008). Despite the stability of this indicator for the whole country, there were significant regional differences. Neoplasms were the fourth group of causes of death in 1980 (PMR=10.4), and the second in 2008 (PMR=16.8%), with a positive percentage change of 62.1%. This trend of strong growth was seen in all...
