Appendix A. Formulae of the Concentration Index

The formula for the Concentration Index (CI) of socioeconomic inequality can be written as follows:

\[ CI = 1 - (2 \times (1 - R_i)) \sum_{i=1}^{n} \frac{h_i}{n\mu} \]

where, \( n \) is the sample size; \( h_i \) is the health measure; \( \mu \) is the mean health measure and \( R_i = \frac{i}{n} \) is the fractional rank in the income distribution of the ith person, with \( i = 1 \) for the poorest and \( i = n \) for the richest.

To account for the bounded nature of the health variable (between zero and one) we applied Erreyger’s correction to the concentration index. The formula for the corrected concentration index (CCI) is:

\[ CCI = \frac{4 \times \bar{y}}{a - b} \times CI \]

where \( \bar{y} \) is mean health status and \( a \) and \( b \) are the maximum and minimum levels of health (in our case zero and one).
