glossary of the terms and notation used. Each chapter ends with a comprehensive list of references, which includes both up to date citations and also the "classics". A feature, which the authors use to great effect, is the liberal inclusion of both real and hypothetical examples; these help to consolidate new concepts, and are essential for the innumerate in following the statistical procedures. This is a very practical book. Even a novice will be able to use the techniques described in the first section, and to follow, at least conceptually, the procedures described in the second part of the book.

As with all books, there are minor irritations: table 6-3 is 11 pages away from its first and only mention; the OPCS has superseded the Ministry of Pensions (p113) as a source of vital status tracing; and the style of English is stodgy in places. Nevertheless, this is an excellent book, which should be on the shelves of every library. It will be invaluable to anyone with an interest in occupational epidemiology, and especially to professionals who do not have ready access to the support of a statistician.

O LI LLOYD

HPV and Cervical Cancer. (IARC Scientific Publication No. 94.) N Muñoz, FX Bosch, OM Jensen. (Pp 155; £19.00.) International Agency for Research on Cancer, Lyon, 1989. ISBN 92-832-1194-4.

The role of the human papillomavirus (HPV) in the aetiology of cancer of the uterine cervix has been one of the most intriguing epidemiological issues of the last decade. Initial optimism that the key aetiological agent had been identified has now been tempered by a realisation that HPV 16/18 can also be identified in the normal cervix and that integration of virus DNA into tumour cell DNA does not necessarily reflect a causal mechanism. Nevertheless, the debate is not yet over, particularly with the continued development of DNA technology and the recognised deficiencies of previous studies, and this book gives an authoritative and readable account (even to the non-specialist) of the story up to last year.

The book is divided into eight chapters: four dealing with the epidemiological evidence, two with DNA hybridisation techniques and the experimental evidence for HPV oncogenicity, and two with clinical issues. Most readers of this journal will turn eagerly to the last chapter, which summarises and tabulates the 30 or so published epidemiological studies and discusses the methodological difficulties encountered. There is also considerable interest for the epidemiological enthusiast in the chapters on time trends and on measurement error. But this is not just a book for the expert. I was gratified to be able to read with reasonable comprehension of the chapter on DNA hybridisation techniques: an understanding of the strengths and limitations of HPV identification is as important as an understanding of the epidemiology in assessing the available evidence. The chapter on oncogenicity is more closely written but it is only four pages long and it rewards a little concentration.

Overall, this is an ideal sort of book: short, readable, paperback, well referenced and with a good eight page summary. Although it deals with a rapidly changing field, the book

references papers as recent as 1988 and it is the best review available at present.

DAVID MANT

Environmental Health Decision Making: the Politics of Disease Prevention. Jens Steensberg. (Pp 325, price not stated.) Almqvist & Wiksell International, 1989. ISBN 91-22-01260-6

This paper back has been written by a medical doctor with a long experience of work in the Danish national health and environmental protection administration, following a period as a visiting scholar at the University of North Carolina in the USA. The research for the work was carried out in 1982 and the text written in 1983. The work has already formed the basis of a PhD degree and appeared as a supplement to the Scandinavian Journal of Social Medicine.

The book is in four parts, each with one or more chapters. Part 1 comprises a background; part 2 covers various aspects of our environment including air, noise, water, food, work, home and chemicals; part 3, the process of decision making, principally in Denmark and the USA; and part 4, a short summary of the politics of disease prevention. There is one 1984 reference in the text and a few for 1982, but most of the references, which total over 500, are for 1981 or earlier.

Although aimed at medical doctors and other health and scientific personnel in the fields of public health policy and administration and of environmental health administration, it is not a reference work. Moreover it is difficult to envisage such a wide appeal for a book with this title which barely mentions the nuclear industry, one of the biggest political issues in environmental health in the past forty years. Indeed the nuclear industry merits only one paragraph, a brief mention of the Three Mile Island incident in 1979. It seems odd for a book with this title to be published in 1989 which makes no mention of Chernobyl, nor the effect this has had on the politics of nuclear power. Although the author justifies the late publication on the grounds that the functions of our administrative and political systems are changing slowly, not many would be prepared to agree.

IAN G JONES

Technology Assessment and New Kidney Stone Treatment Methods. (Commission of the European Communities Health Services Research Series No. 4.) Eds F Kamper-Jorgensen, S Challah, T Folmer Andersen. (Pp 189; £25.00.) Oxford University Press, 1988. ISBN 0-19-2616-498.

This is the proceedings of a workshop held in Copenhagen in March 1986 and sponsored by the Health Services Research Committee of the European Economic Community. As a step towards European collaboration in the assessment of health care technology—a difficult task being tackled by only a few researchers in each country—it is welcome. Nevertheless, it must be judged against the high standards set by the published proceedings of two previous workshops devoted to health technology assessment: that held in Switzerland in April 1982 and devoted to renal dialysis, computerised tomography and cimetidine,¹ and that held in Birmingham

in October 1984 and devoted to economic perspectives on health technology assessment.²

Judged by these criteria, the book devoted to kidney stone treatment methods is disappointing. First, it engenders real concern that neither the theory nor the practice of health technology assessment has advanced since 1982, at least in Europe. Of the three countries that claim to have tried, or begun, to assess extracorporeal shock wave lithotripsy (ESWL), only the United Kingdom generates a chapter that is both clear and detailed. That chapter tells how the randomised trial proposed by researchers was rejected as unethical by urologists confident that ESWL was markedly superior to all other therapies. Unfortunately, the descriptive, and therefore much weaker, study that replaced the proposed trial has since suggested that ESWL may be less effective, and less efficient, than percutaneous nephrolithotomy.³ Thus, although all concerned (clinicians, researchers and the British Department of Health) acted with the best of intentions, the first British assessment of ESWL generated little firm evidence.

Unfortunately, the book under review will do little to improve the mediocre standards of health technology assessment that it portrays. The editors have failed to exercise either the sapiential leadership or the editorial skills that characterised their predecessors.^{1,2} The result is a pot-pourri of contributions from seven countries that will tell researchers little about new kidney stone therapies, and urologists little about health technology assessment.

Disablement in the Community. Ed Donald L Patrick, Hedley Peach. (Pp 230; £17.50.) Oxford University Press, 1989, ISBN 0-19-261434-7.

The recent national survey on disability has highlighted the extent of need amongst those living in the community. This book reports on one local survey carried out between 1977 and 1983 in the London borough of Lambeth. We are told that the various elements of the survey, referred to in the text as the "Lambeth studies", were planned as an inquiry to provide information on the epidemiology of disablement, in order to apply this information to health and social policy questions affecting the community, and disabled people in general.

Donald Patrick introduces the book with a chapter on the sociomedical approach to disablement, using the concepts of impairment, disability and handicap from the International Classification of Impairments, Disabilities and Handicaps (ICIDH), published by WHO in 1980. After opening chapters which deal largely with methods, the book is loosely structured on these concepts, with later chapters dealing with impairment

and disability, and the various aspects of disadvantage (handicap), such as economic self sufficiency and social integration, that can arise.

The survey used similar methods to others of the genre, but it also included additional investigations, notably a longitudinal element, and there is an interesting chapter which examines the methods, as well as the results of this aspect of the survey. Readers will obtain a rare opportunity to consider the dynamics of disability in the community, although a more detailed examination of these dynamics and their implications for service delivery would have strengthened this chapter considerably.

The epidemiological or "community" dimensions of disability is only really found in the introductory chapters, and for example David Locker's chapter on coping with disability and handicap focuses on a small group of people disabled by rheumatoid arthritis. This is not to deny the value of the different insights offered, but those looking for a community wide perspective would find it difficult to translate some of the information to that level. The book is perhaps best viewed as a "reader" for disability in the community, as the chapters (and some show their origins as previously published papers) are best viewed as separate insights into the different dimensions of disability and handicap.

ALAN TENNANT

Prospects for Primary and Secondary Prevention of Cervix Cancer. (Cancer Surveys, vol 7, No 3.) Eds EG Knox, C Woodman. (Pp 200; £26.50.) Oxford University Press, 1988. ISBN 0261-2429

With the recent upsurge of interest in the establishment of effective cervix cancer screening has come the recognition that an organised multidisciplinary approach is needed, integrating the epidemiological, behavioural, clinical and laboratory aspects of screening. Too often, experts in any one of these areas are unaware of developments in the others, and it is difficult for those responsible for organising screening programmes to obtain an overview of all these aspects. This issue of Cancer Surveys should help to remedy these deficiencies, though a disappointing omission is the lack of any social science perspective on participation in screening.

The first part of the book is concerned with epidemiological and organisational aspects of cervix cancer screening, beginning with a sensible introduction by the editors, indicating that technical advances in the various areas do not automatically lead to an effective screening programme. This is followed by a very complex chapter by the same authors, measuring the effectiveness of cervix cancer screening using statistical modelling, which would probably be beyond the understanding of most readers. Hakama and Louhivuori have contributed a valuable chapter on the effective population based Finnish programme, which provides useful lessons for other countries. (Some gremlins seem to have converted Matti Hakama to "she" in the biographical notes). The chapter by Cuzick and Boyle provides interesting and detailed data on trends in cervix cancer mortality by age for 15 different countries from 1950-1985.

The second half of the book is concerned

mainly with basic laboratory research, including a chapter on recent work in developing biological markers for predicting progression of preinvasive lesions, two (largely historical) chapters on the role of herpes simplex virus, which make interesting reading in view of the current interest in human papilloma virus (HPV), and another on the possible role of Epstein-Barr virus. Three chapters on HPV provide a useful summary of current work in this area. The excellent and balanced chapter by Meanwell on the epidemiology of HPV should be required reading for all clinicians. The book concludes with a comprehensive summary of treatment of cervical intraepithelial neoplasia, including pretreatment assessment, treatment options, and management of treatment failure.

This book would be a useful resource for anyone working in cervix cancer screening. For the most part it is straightforward and readable, and it provides information which is not usually readily available in one source.

JUDITH STRATON

Short Reviews

Perinatal and Multigeneration Carcinogenesis. (IARC Scientific Publication No 96.) Eds NP Napalkov, JM Rice, L Tomatis, H Yamasaki. (Pp 436; £48.00.) International Agency for Research on Cancer, Lyon, 1989. ISBN 92-832-1196-0.

The possible effects of perinatal exposure to carcinogens are among a number of research topics in which IARC has been heavily involved. This present book comprises the proceedings of a meeting on this subject held in Leningrad in 1988 in which the purpose was to discuss the present state of research from the perspective of a variety of disciplines—epidemiology, pathology, biochemistry and molecular biology. This multidisciplinary approach is reflected in the content of the book, which is divided into three sections: (1) experimental carcinogenesis: models; (2) experimental carcinogenesis: mechanisms; and (3) studies related to direct observations in humans. This latter epidemiological section includes overviews of studies concerned with exposure to chemicals, diethylstilboestrol, and ionising radiation. This is a useful book for those interested in this aspect of epidemiology.

Foetus into Man. Physical Growth from Conception to Maturity. JM Tanner (Pp 280; £6.00.) Castlemead Publications, 1989. ISBN 0-948555-23-8.

This is the second edition of a book which was first published in 1977 and describes the process of growth in children. Although parts of the book are concerned with biological and endocrinological aspects, much emphasis is given to epidemiological issues. The book is attractive in presentation and the author has undoubtedly produced a book which "the

biologically unsophisticated reader will understand and the biologically sophisticated approve". It may therefore be an appropriate book for epidemiologists and those interested in community child health who wish an authoritative, but not indigestible, treatise on normal growth.

Clinical Effects of Environmental Chemicals. A Software Approach to Etiological Diagnosis. RD Kimbrough, KR Mahaffey, P Grandjean, S-H Sandoe, DD Rutstein. (Pp 110; £36.00.) Hemisphere Publishing Corporation, 1989. ISBN 0-89116-921-0.

With intoxications due to environmental chemicals, the causative substances are frequently hard to identify from a patient's exposure history. Even when exposure information is obtained, several chemicals may be involved, or the composition of the chemical products may be unknown. In such cases the clinical picture can be an important guide to the aetiological diagnosis. Following an introductory overview of the subject, this book is divided into three parts: the first provides an alphabetical listing of environmental chemicals and describes the symptoms and signs associated with each. The second part provides a list of symptoms and signs and describes the chemicals which may be an aetiological factor for each. The third part comprises a comprehensive list of references of the clinical effects of individual chemicals. Thus this book is essentially a useful reference text. A floppy disk is also enclosed so that the reference system may be accessed on computer if preferred.

Dioxins and Furans. T Paddock. (Pp 113; \$10.00.) Academy of Sciences, Philadelphia, 1989. ISBN 0-910006-08-3.

This booklet consists of a comprehensive, concise and easy to read review of scientific information on dioxins and furans. It includes a short history of the incidents and issues that have made dioxin a household word and discusses how dioxins and furans are regulated. It is fully indexed and annotated and should be of interest to those concerned with environmental health.
