Epidemiology—past and future. A joint meeting between the UK Society for Social Medicine and the *Journal of Epidemiology and Community Health* is to be held on Thursday, October 30, 1997 at the Weston Theatre, Manchester Conference Centre, UMIST from 10.00—16.30. Further details from Professor Charles Florey, Dept of Epidemiology and Community Health, Ninewells Hospitals and Medical School, Dundee DD1 9SY. Tel 01 + 382 632124. Fax 01 + 382 644197

Good Occupational Health Practice and Evaluation of Occupational Health Services, 8–10 June 1998, Hanasaari Cultural Centre, Espoo, Finland. Themes: good occupational health practice, evaluation, future perspectives. Deadline for abstracts: 31 January 1998. For further information: Ms Inkeri Haataja, Finnish Institute of Occupational Health, Topeliuksenkatu 41 aA, FIN-00250 Helsinki. Tel: +358 9 474 7470. Fax: +358 9 474 7548. email: Inkeri.Haataja@occuphealth.fi. <http://www.occuphealth.fi/tiedotus/gohp>.

BOOK REVIEWS

A simulation model for the future analysis of cardiovascular disease (with program diskette). O J Vriez, G M Boas, and J A H Janssen. A report commissioned by the Steering Committee on Future Health Scenarios (STG). (Pp 388; £45.00) Utrecht: International Books, 1995. ISBN 90-6224-878-0.

Health planning consists of formulating health goals and the means necessary for achieving these. Planning is thus a rational way of allocating resources so that the future can be steered in the most desirable direction. Setting objectives involves projecting foreseeable health scenarios, contrasting situations where healthcare intervention is absent and then where it is present. It is, therefore, extremely useful to have a software package capable of formulating future scenarios linked to the frequency of cardiovascular disease, and exploring the consequences thereof on the health of the general population, the pub-

lic health system, and, in particular, the distribution of any related costs.

The software package, designed for DOS-based computers, comes complete with a user's manual which includes full information on the cardiovascular disease model used, development of the financial aspects, plus a wide ranging review of current knowledge on risk factors for cardiovascular disease and the efficacy of available preventive measures and methods of treatment.

The software is user friendly. Construction of scenarios and evaluation of the ensuing consequences requires data on: cardiovascular disease risk factor distribution in the target population; the expected effect of healthcare intervention on this distribution; cardiovascular disease incidence and fatality; and the natural history of the process in the absence of intervention. The fact that experts from the Mathematics, Health Economics, and Cardiology Departments at Limburg University collaborated on this project has ensured that both software and manual are marked by methodological rigour. In all three disciplines, book and diskette will prove a useful tool to those interested in health planning and a source of inspiration for the development of new products in this field.

Lastly, though software and manual are of universal interest, the fact that they are specifically based on the Dutch population and related cardiovascular risk factor distribution detracts somewhat from the program's utility vis-à-vis other populations. Furthermore, it would have lent greater insight, had the manual contained some information on the experience and impressions of Holland's Public Health Authority planners on using this software in the course of their routine work.

FERNANDO RODRÍGUEZ ARTALEJO

Management of neurological disorders. Edited by CM Wiles. (Pp 341; £24.95). London: BMJ Publishing Group, 1995. ISBN 0-7279-0903-7.

This book will either delight or slightly disappoint depending on the aims of the reader. It is a compilation of articles previously published in the *Journal of Neurology, Neurosurgery and Psychiatry* on the management of a wide variety of chronic neurological conditions, including meningitis. The book is well written, clear, and in general easy to read. It has useful summary boxes to highlight key points. The authors are all experts in their respective fields, and the chapters have fairly extensive references. Refreshingly, the authors have been encouraged to conclude their reviews with a section on auditing clinical care. This is done with less consistent success and perhaps reflects more the novelty of audit in neurology than any specific failings of the contributors. I was particularly pleased to see and enjoyed reading two chapters on "Resources and facilities" and "Neurorehabilitation", areas that are often neglected.

This book will be most useful for junior level hospital physicians, general practitioners, and medical students and is to be recommended. However, for public health physicians and purchasers it is of limited value or perhaps can be used as a first source of information. The sections on audit are on the "sketchy" side and the epidemiological content would make "needs assessment" difficult. Sur-
