that included probing depth (PD) and clinical attachment level (NIC) DCVI and was represented by one of the following outcomes: Coronary Artery Disease (CAD), Myocardial Infarction (AMI) with or without angina pectoris, or Acute Coronary Syndrome (ACS). The quality of the articles was assessed using criteria recommended in “The Strengthening the Reporting of Observational Studies in Epidemiology-STROBE”. In addition, compliance with the guidelines of the guide to meta-analysis for observational studies-MOOSE.

**Results**

Of the 23 studies, case-control eligible, 16 had their results combined using the methodology of meta-analysis. The overall OR was approximately 2.52 (95% CI 2.109 to 3009, p<0.001), indicating that individuals with PD have an increased chance of developing ischaemic CDH as compared to those without PD.

**Conclusion**

Observational case-control suggest that individuals with PD are more likely to develop ischaemic CDH, however, further studies are needed for more definitive conclusions.

**P2-46 ASSESSING THE HEALTH RELATED QUALITY OF LIFE AND EFFECTIVE FACTORS: A POPULATION BASED STUDY**

doi:10.1136/jech.2011.142976h.81

1,2O¨ U¨ lger, 3M Çoil,* 1Ministry of Health, Ankara, Turkey, Turkey, 2Ankara University Medical Faculty, Ankara, Turkey, Turkey

**Introduction**

This study has been planned to determine quality of life of people in one health center area, and the effect of sociodemographic factors, hypertension and other chronic diseases.

**Methods**

This cross-sectional study is conducted among residence of age 40 and over, living at the Park Health Center Area in Ankara-Turkey. Three hundred participants from the eligible population (n=5962) were chosen by simple random sampling of these 260 (36.6%) reached. Twenty for questions for sociodemographic factors and chronic diseases and short form SF-36 health survey questionnaires had been administered to each participant. Data analysis was performed by using SPSS for Windows program, Mann-Whitney U, Kruskal-Wallis and multiple linear regression analysis were used for statistical analysis.

**Results**

The mean of general SF-36 score of the study group was 21.9 (95% CI 59.1 to 64.5). The scores for physical functioning, physical role, bodily pain, general health, vitality, social functioning, emotional role and general mental health scales were found to be low. It was determined that older age, female sex; low education level, hypertension and other chronic diseases had significant effect on various scales of the SF-36.

**Conclusion**

The SF-36 scores of the study population were found to be low. It was determined that older age, female sex; low education level, hypertension and other chronic diseases have a negative effect on quality of life. According to results multidisciplinary approach and efforts are necessary for promoting quality of life.

**P2-47 INCREASING INCIDENCE OF BARRETT’S OESOPHAGUS: A POPULATION BASED STUDY IN NORTHERN IRELAND**

doi:10.1136/jech.2011.142976h.82

1,H Coleman,* 1S Bhat, 1L Murray, 2D McManus, 1,2A Gavin, 1B Johnston. 1Queen’s University Belfast, Northern Ireland, UK, 2Belfast Health and Social Care Trust, Northern Ireland, UK, 2Northern Ireland Cancer Registry, Northern Ireland, UK

**Introduction**

Oesophageal adenocarcinoma (OAC) incidence rates have increased in recent decades, particularly among white males in Western societies. Rising Barrett’s oesophagus (BO) incidence, the pre-cursor condition for OAC, may explain this phenomenon. However, increasing BO incidence may also simply reflect changes in endoscopy practices together with improvement in disease recognition. The aim of our investigation was to assess BO incidence over a 13-year period using a population-based register in Northern Ireland.

**Methods**

The Northern Ireland Barrett’s oesophagus Register is a population-based register of all adults diagnosed with BO, defined as columnar epithelium of the oesophagus, in Northern Ireland between 1993 and 2005. Annual BO incidence rates were calculated per 100 000 of the population, per 100 upper gastro-intestinal endoscopies and per 100 oesophageal biopsies performed in Northern Ireland.

**Results**

During the 13-year period, 197 635 patients underwent an endoscopy and 9529 of these were diagnosed with BO. Average annual BO incidence rates rose by 2.5-fold, increasing from 31.9/100 000 during 1993–1997 to 80.1/100 000 during 2002–2005. Over the same time, there were 1.3- and 1.6-fold increases in endoscopy and biopsy rates in the population, respectively. Even with increasing rates of endoscopy and biopsy, BO was still diagnosed more frequently per 100 endoscopies and per 100 biopsies.

**Conclusion**

BO incidence rates in Northern Ireland have increased more rapidly than the rate of endoscopies or biopsies. This could indicate that a true rise in BO incidence has occurred, contributing to the increase in OAC seen in Western populations.

**P2-48 SECULAR CHANGES OF OVERWEIGHT AMONG BRAZILIAN ADOLESCENTS: AN UPDATE**

doi:10.1136/jech.2011.142976h.83

W Conda,* C Monteiro. Public Health School, University of Sao Paulo, Sao Paulo, Brazil

**Introduction**

Overweight in adolescents is worldwide and have been growing faster in the last three decades. In Brazil, data from three national surveys show that prevalence of overweight among male fivefold from 1974–1975 to 2002–2003 and flat among female from 1989 to 2002–2003.

**Objective**

To update changing trends of overweight among Brazilian adolescents across last 4 decades.

**Methods**

Data are age-ranged 10–19 years and come from four nationwide surveys: ENDEF-1974–1975, PNSN-1989, POF-2002–2005 and POF 2008–2009. Overweight was classified according to IOTF’s purpose as the BMI values greater than the adult equivalent 25 kg/m² critical values. Change in risk of overweight across survey periods was estimated using ratio of prevalence (RR).

**Results**

Among boys, prevalence of overweight was 2.4, 5.7 and 13.2 and 17.3% at 1974–1975, 1989, 2002–2003 and 2008–2009, respectively; among girl, prevalence of overweight was 6.0, 11.8, 12.5 and 16.3% at same survey, respectively. From 2002–2003 to 2008–2009 overweight increased across all age groups and income strata, both sexes. RR for changing trends from 1974–1975 to 1989, 1989 to 2002–2003 and 2002–2003 to 2008–2009 among the fifth poorest male are 2.6, 7.5, 10.1, respectively and among the fifth richest male are 2.1, 3.3 and 4.4, respectively. Among the poorest female RR are: 2.1, 2.4 and 3.7 and among richest fifth are 2.0 1.5 2.1, respectively.

**Conclusion**

In general, overweight expanded stronger in the last decade. Female adolescents in Brazil has reversed flat trend and are going to increase body mass index at all age and income strata.
