**P2-254** EXPOSURE TO TRAFFIC AND CANCER HOSPITALISATION IN SÃO PAULO

A Ribeiro,* A Nardocci. University of São Paulo, São Paulo, Brazil

**Introduction** Previous studies in developed countries have documented associations between air pollution and risk of some neoplasms. We explored the association of traffic-related air pollution with hospitalisations for cancer groups.

**Methods** Our analysis included all individuals admitted to public or private hospitals in São Paulo from 2004 to 2006 with a main diagnosis of primary invasive cancer. Only the first individual admission was considered, from which age, sex, diagnosis and home address were extracted. We calculated total, gasoline and diesel vehicles traffic density, from traffic counts data, for 4964 geographical units with a population of 20 or more inhabitants, formed by a grid of 500 by 500 m. We used logistic regression models adjusted by the Human Development Index of the area for groups of cancer.

**Results** There was an increased risk of hospitalisation for respiratory neoplasms in adults and for haematologic neoplasms in children and adolescents associated with living in areas with higher total traffic density and traffic density for vehicles powered by gasoline and diesel, with a clear dose-response gradient. The Rate ratios of these neoplasms for the highest category of exposure to total density traffic were, respectively, 3.51 (95% CI 2.26 to 4.87) and 2.35 (95% CI 1.59 to 3.49).

**Conclusion** Our study suggests an association between traffic air pollution and hospital admissions for respiratory and haematologic cancers. The adjustment for potential confounding variables, the use of more sophisticated exposure assessment models and of incidence data are needed to more directly investigate the cause and effect relationship.

**P2-256** DESCRIPTIVE DATA ON WORK-RELATED CANCER IN BRAZIL: AN ANALYSIS WITH COMPENSATION BENEFITS

F Ribeiro,* Y Santana, W Souza. Rio de Janeiro State University and National Cancer Institute, Rio de Janeiro, Brazil; 2Institute of Collective Health, Federal University of Bahia, Salvador, Bahia, Brazil; 3University of Brasilia, Brasilia, Brazil

**Introduction** Alcohol and tobacco are the most important risk factors for head and neck cancers (HNC). However, in some countries, it has been observed an increase in incidence rates, particularly among young people and among non-drinkers and non-smokers. These trends have increased the debate about the role of human papillomavirus (HPV) and several studies suggest that this infection may play a causative role in oropharyngeal tumours. This study aims to assess the magnitude of cancers potentially related to HPV in Brazil.

**Methods** Time series study including deaths due to HNC registered in Brazil, from 1980 to 2007. Annual percentage change (APC) was described for 100 000 people, according to tumour site (HPV-related or non-HPV related) and sex. Annual percentage change (APC) was calculated through Joinpoint modeling method, using the calendar year as regressor variable.

**Results** We observed a statistically significant increasing trends in mortality rates due to HPV-related HNC among males in the periods of 1980–1994 (APC=2.4, 95% CI 1.0 to 3.8) and 1997–2005 (APC=4.0, 95% CI 0.8 to 7.4), followed by a decrease in 2005–2007 (APC=−2.7, 95% CI −4.6 to −1.4), while for females a significant increase in rates was observed between 1980 and 1998 (APC=7.6, 95% CI 0.3 to 15.4), followed by a decreasing trend in the period 1998–2007 (APC=−2.7, 95% CI −4.2 to −1.3). Regarding non-HPV related HNC, significant changes were only observed for females (1980–2007, APC=−2.1, 95% CI −2.8 to −1.4).

**Conclusion** Important decreases in HPV-related HNC mortality were recently observed in Brazil, particularly among females. These results can suggest that these trends reflects better prognosis related to HPV-positive HNC.

**P2-255** TRENDS IN MORTALITY DUE TO POTENTIALLY HPV-RELATED HEAD AND NECK CANCERS IN BRAZIL, 1980–2007

A Manso, I Oliveira, F Yazawa, M A Veras, K Ribeiro.* Faculdade de Ciências Médicas da Santa Casa de São Paulo, São Paulo, Brazil

**Introduction** Alcohol and tobacco are the most important risk factors for head and neck cancers (HNC). However, in some countries, it has been observed an increase in incidence rates, particularly among young people and among non-drinkers and non-smokers. These trends have increased the debate about the role of human papillomavirus (HPV) and several studies suggest that this infection may play a causative role in oropharyngeal tumours. This study aims to assess the magnitude of cancers potentially related to HPV in Brazil.

**Methods** Time series study including deaths due to HNC registered in Brazil, from 1980 to 2007. Annual adjusted mortality rates are described for 100 000 people, according to tumour site (HPV-related or non-HPV related) and sex. Annual percentage change (APC) was calculated through Joinpoint modeling method, using the calendar year as regressor variable.

**Results** We observed a statistically significant increasing trends in mortality rates due to HPV-related HNC among males in the periods of 1980–1994 (APC=2.4, 95% CI 1.0 to 3.8) and 1997–2005 (APC=4.0, 95% CI 0.8 to 7.4), followed by a decrease in 2005–2007 (APC=−2.7, 95% CI −4.6 to −1.4), while for females a significant increase in rates was observed between 1980 and 1998 (APC=7.6, 95% CI 0.3 to 15.4), followed by a decreasing trend in the period 1998–2007 (APC=−2.7, 95% CI −4.2 to −1.3). Regarding non-HPV related HNC, significant changes were only observed for females (1980–2007, APC=−2.1, 95% CI −2.8 to −1.4).

**Conclusion** Important decreases in HPV-related HNC mortality were recently observed in Brazil, particularly among females. These results can suggest that these trends reflects better prognosis related to HPV-positive HNC.

**P2-257** SOCIAL DETERMINANTS AND HIGH RISK BEHAVIOURS IN DRUG USERS UNDER METHADONE TREATMENT IN GOLESTAN PROVINCE, NORTH IRAN

M Gholipour,* A Khoshkho, A Badkehsar, F Alvandi, M Rofouei, M Vakili, A Sahebkar, A Khoshkho, A Badkehsar, F Alvandi, M Rofouei, M Vakili, A Sahebkar. 1Community Medicine Department, School of Medicine, Golestan University of Medical Sciences, Gorgan, Golestan, Iran; 2Endocrinology Metabolism Research Centre, Tehran University of Medical Sciences, Tehran, Iran; 3Epidemiology and Biostatistics Department, School of Public Health, Tehran University of Medical Sciences, Tehran, Iran; 4Deputy of treatment, Golestan University of Medical Sciences, Gorgan, Iran; 5Iran university of Medical Sciences, Tehran, Iran; 6Psychiatric Department, School of Medicine, Golestan University of Medical Sciences, Gorgan, Golestan, Iran

**Introduction** Drug users’ health is a product of drug-effects and risk behaviours. Social determinants can shape some health behaviours. There has been little research on social determinants and risk behaviours related to drug use in Iran. We aimed to estimate this in patients undergoing methadone treatment in north Iran.
**Methods** 400 addicts were recruited from methadone clinics in 2009–2010. A self-designed questionnaire with excellent reliability was used to determine those with and without high risk behaviours. ORs with 95% CIs were estimated by logistic regression. Ethics approval was obtained from Tehran University.

**Results** There was significant difference between the two study groups (with and without high risk behaviours) in economic status, drug type, administration route, age, and drug abuse onset age. Education level was significantly lower in women. One quarter experienced homelessness, 62% had no support from any insurance or supportive organisations, only 26% had constant employment and over 50% had prison history. 12.5% were injection users and 14% shared syringes. One quarter reported high risk sexual behaviour and 69.4% had not used condoms in last their sex encounter (significantly lower in women). A decrease of one year in age was associated with decreased drug use onset age and increased sexual risk behaviours by 6% (AOR=0.94, 95% CI 0.91 to 0.98) and 10% (AOR=0.91, 95% CI 0.85 to 0.97) respectively. Poor economic status reduced risk sexual behaviour (AOR=0.55, 95% CI 0.15 to 0.96). Prison history increased injection behaviour more than twice (AOR=2.89, 95% CI 1.4 to 5.95).

**Conclusions** These findings illustrate that interventions are needed in young heroin users even in those with a good economic state.

**P2-258 EVALUATION OF THE EFFECTIVENESS OF THE PHARMACOTHERAPY FOLLOW-UP ON THE TREATMENT OF HYPERTENSION PATIENTS: A COHORT STUDY**

doi:10.1136/jech.2011.142976j.91

1F Rodrigues, 2M Castro, 3S Fuchs, 1L Moreira. 3Postgraduate Studies Program in Health Sciences: Cardiology and Cardiovascular Sciences; UFRGS, Porto Alegre, Rio Grande do Sul, Brazil; 2Division of Cardiology, Hospital de Clinicas de Porto Alegre, Porto Alegre, Rio Grande do Sul, Brazil; 3Pharmacy School, UFRGS, Porto Alegre, Rio Grande do Sul, Brazil

**Introduction** The control rate of hypertension in the population is fair. Pharmaceutical Care is a recent approach, seeking to magnify therapeutic results.

**Objective** To evaluate the effectiveness of the pharmacotherapy follow-up conducted by the Pharmacist on hypertension management.

**Methods** The study is a historical cohort with a dynamic population of patients referred to an outpatient hypertension clinic. Patients were followed for 12 months. Those difficult-to-control referred by the physician to pharmacotherapy follow-up were compared with patients under conventional treatment. Endpoints included blood pressure (BP) variation and the rate of control (BP <140/90 mm Hg). General Linear Model, modified Poisson Regression, and segmented regression were used in the data analysis.

**Results** Of 993 patients, 150 were referred for pharmacotherapy follow-up. Patients in the pharmacotherapy follow-up were older, with lower education level, longer diagnoses of hypertension and significantly higher levels of BP. The deltas of SBP were 7.4±1.9 vs 10.5±0.8 mm Hg (p=0.16) and diastolic 6.7±1.0 mm Hg vs 5.9±0.4 (p=0.45) for pharmacotherapy follow-up and conventional treatment groups, respectively, adjusted for initial pressure. The control rate was 45.3%, being 28.1% in the exposed and 48.6% in the unexposed (p<0.001). Comparing the BP of the same patients before and after exposure to pharmacotherapy follow-up showed a change in the trend of SBP and DBP (p<0.001).

**Conclusion** Hypertensive patient difficult-to-control under pharmacotherapy follow-up showed a reduction in BP similar to patients who received only conventional treatment. The study suggests that pharmacotherapy follow-up is effective in the management of selected hypertensive patients.
