positive linear relationship between adherence and cessation rates however, adherence to NRT among unmotivated smokers is uncertain.

**Methods** Chinese smokers who aged ≥18, had no intention to quit within 4-week and had no contraindication to NRT were recruited and randomly allocated to Group A1, A2 and B in a RCT. Only Group A1 and A2 were provided 8-week free NRT. We reported 8-week adherence rate to NRT at 3-month and reasons for non-compliance among subjects in Group A1 and A2.

**Results** From October 2004 to April 2007, 1154 smokers were recruited ([Group A1 = 479; A2 = 449; B = 226]). Subjects in Group A1 and A2 ([n = 928]) were 42.0 ± 10.5-year-old and smoked 19.6 ± 9.4 cigarettes daily on average. We contacted 797 subjects (85.9%) for 3-month follow-up, but those who did not receive 8-week free NRT ([n = 115; 14.4%]) were removed from the analysis. 35.4% ([575/682]) used NRT as the recommended regime, 41.6% ([284/682]) did not fully comply with the prescription and 3.0% ([20/682]) even did not use it. Among 304 ([n = 254 + 20]) who did not comply, "Forget to use" ([24.0%]) and "Side effects" ([14.5%]) are the two most cited reasons for non-compliance.

**Conclusion** The adherence rate in this study is more encouraging compared to a local study ([20.0%]) which only provided 1-week free NRT. Thus, providing the entire course of free NRT seems to yield an improved NRT adherence among unmotivated Chinese smokers.

**SP4-23** SOCIAL POSITION AND RISK OF DEMENTIA IN PEOPLE WITH HIGH LEVELS OF ABSOLUTE POVERTY BUT LOW LEVELS OF CARDIOVASCULAR RISK FACTORS AND DEPRESSION: THE ANHUI COHORT STUDY

doi:10.1136/jech.2011.142976p.17

1R Chen,* 1University of Wolverhampton, Wolverhampton, UK; 2Anhui Medical University, Hefei, China

**Introduction** The relationship between dementia and socioeconomic deprivation is unclear. This study examined the association between social position and dementia, and determined the prevalence of depression with high levels of absolute poverty but low levels of cardiovascular risk factors and depression.

**Methods** Prospective cohort study of 1766 elders in rural and urban community-dwellings in Anhui, China. Standardised mental status measures were administered and socioeconomic and risk factors were characterised at baseline. At 6.2-year follow-up, dementia cases were identified using the 10/66 algorithms, causes of death and reports by psychiatrists.

**Results** The world age-standardised prevalence of dementia diagnosed using the 10/66 algorithms in people with high levels of absolute poverty but low levels of cardiovascular risk factors and depression.

**Conclusion** The adherence rate in this study is more encouraging compared to a local study ([20.0%]) which only provided 1-week free NRT. Thus, providing the entire course of free NRT seems to yield an improved NRT adherence among unmotivated Chinese smokers.

**SP4-24** SELF-REPORTED TOBACCO SMOKING PRACTICES AMONG MEDICAL STUDENTS AND THEIR PERCEPTIONS TOWARDS TRAINING ABOUT TOBACCO SMOKING IN MEDICAL CURRICULA: A CROSS-SECTIONAL, QUESTIONNAIRE SURVEY IN MALAYSIA, INDIA, PAKISTAN, NEPAL, AND BANGLADESH

doi:10.1136/jech.2011.142976p.18

1C Sreeramareddy,* 1S Suri, 2G Menezes, 2H N Harsha Kumar, 3M Rehman, 3R Islam, 4M Shah, 5B Sathian, 6X V Pereira, 4U Shetty, 7N R Vyaswani. 1Malaka Manipal Medical College, Melaka, Malaysia; 2Kasturba Medical College, Mangalore, India; 3Faridpur Medical College, Faridpur, Bangladesh; 4CMH, Lahore Medical College, Lahore, Pakistan; 5Manipal College of Medical Sciences, Pokhara, Nepal; 6AJ Institute of Medical Sciences, Mangalore, India; 7Yenepoya Medical College, Mangalore, India

**Introduction** Tobacco smoking issues in developing countries are usually taught non-systematically as and when the topic arose.

**Methods** A cross-sectional questionnaire survey was carried out among final year undergraduate medical students. An anonymous, self-administered questionnaire included items on demographic information, students’ current practices about patients’ tobacco smoking habits, their perception towards tobacco education in medical schools on a five point Likert scale. Questions about tobacco smoking habits were adapted from GHPPS questionnaire.

**Results** Overall response rate was 81.6% ([922/1130]). Median age was 22 years while 50.7% were males and 48.2% were females. The overall prevalence of “ever smokers” and “current smokers” was 31.7% and 13.1% respectively. A majority (>80%) of students asked about patients’ smoking habits. Only a third of them did counselling, and assessed the patients’ willingness to quit. Majority of the students agreed about doctors’ role in tobacco control as being role models, competence in smoking cessation methods, counselling, and the need for training about tobacco cessation in medical schools. About 50% agreed that current curriculum teaches about tobacco smoking but not systematically and should be included as a separate module. Majority of the students indicated that topics about health effects, nicotine addiction and its treatment, counselling, prevention of relapse were important or very important in training about tobacco smoking.

**Conclusion** Medical educators should consider revising medical curricula to improve training about tobacco smoking cessation in medical schools. Our results should be supported by surveys from other medical schools in developing countries of Asia.

**SP4-25** POPULATION SURVEY OF SEMEN QUALITY IN YOUNG SCOTTISH MEN

doi:10.1136/jech.2011.142976p.19

1P Warner,* 2S Irvine, 2R Sharpe, 4R Agius, 5A Porter, 6F Farragher. 1Centre for Population Health Sciences, The University of Edinburgh, Edinburgh, UK; 2NHS Education for Scotland, Glasgow, UK; 3MRC Human Reproductive Sciences Unit, Edinburgh, UK; 4Centre for Occupational and Environmental Health, University of Manchester, Manchester, UK; 5Public Health Directorate, NHS Hilt, Hilt, UK; 7Institute of Health Sciences, University of Leeds, Leeds, UK; 8NHS National Services Scotland, Edinburgh, UK

**Introduction** For years concerns have been raised that male semen quality is declining globally, and that this is a birth cohort effect. However, there has been a degree of subject selection bias and trend estimates have been ecological. Our study aimed to examine semen quality in a representative sample of a general population (Scottish), and to explore trend by birth year within the data.

**Methods** A randomly selected sample of 22–32-year-old Scottish-born men were recruited to a survey of male reproductive health. Background information was collected by questionnaire and men were asked to provide a semen sample for analysis.
