between regional and national level was the key to have these interventions happen rapidly.

**P1-86** EPIDEMIOLOGY OF CHILDHOOD ROAD TRAFFIC INJURY: IN BANGLADESH YIELD OF THE LARGEST COMMUNITY BASED SURVEY

doi:10.1136/jech.2011.142976c.79

1MD K ul Baset, 1AMA M Rahman, 1S Rahman, 1S M S R Masrekhe, 2E Towmer. 1Centre for Injury Prevention and Research Bangladesh (CIPRB), Dhaka, Bangladesh; 2University of the West of England, Bristol, UK

**Introduction** Road traffic injuries (RTIs) are a leading cause of morbidity, disability and mortality in low income countries. 95% of child road deaths occur in low and middle income countries. Good data are needed to raise awareness of the scale of the problem and to develop and target injury prevention programmes.

**Objective** To identify the causes of death in women of childbearing age: experience report.

**Methods** A cross sectional study was conducted to determine the current childhood road traffic injury situation in Bangladesh. Face-to-face interviews were used. Multi stage cluster sampling was used to select the sample.

**Result** Nationally representative data were collected from 171,366 rural and urban households. In the sampled households 351,651 children aged 0–17 years were identified; 178,285 were males and 173,366 females. The rate of non-fatal RTI among children under 18 years of age was calculated as 186.55 per 100,000 child-year. The highest incidence (216.06/100,000 child-year) was found among the 5–9 years age group. Among the total children with non-fatal RTI 75.2% were male and 24.7% were female. The incidence of childhood RTI was found to be three times higher in rural children than urban children. Most of the childhood RTIs were pedestrian injuries. The rate of fatal RTI was 5.97 per 100,000 per year among all children.

**Conclusion** The study has confirmed that childhood RTI is a major public health problem in Bangladesh particularly in rural areas. An appropriate prevention programme is urgently required to prevent fatal and nonfatal RTIs in rural areas.

**P1-87** SURVEILLANCE OF DEATH FOR WOMEN OF CHILDBEARING AGE: EXPERIENCE REPORT

doi:10.1136/jech.2011.142976c.80

M Bastos,* J Armond, S Prado. Universidade de Santo Amaro, São Paulo, SP, Brazil

**Introduction** Since the establishment of policies of humanisation of delivery and to obtain more accurate data on causes of maternal deaths, maternal mortality in Brazil declined. Pregnant women have been given priority in health services. As a result, we started to notice difficulty getting care in health services.

**Objectives** To identify the causes of death in women of childbearing age (10 to 49 years), to prevent them in the Public Health Unit.

**Methods** Time series from 2005 to 2009 that evaluated the death certificates of women of childbearing age in the region studied. After checking the main causes of death was held discussion with staff of the Unit on shares, which were immediately put into practice (task force for preventive gynaecological examinations, diagnosis of sexually transmitted diseases, and chronic degenerative diseases).

**Results** There were 386 deaths of women of childbearing age in the period studied. As causes, undetermined and without care (19.2%), heart disease 10.9%, 10.7% violent death, cerebrovascular events 6.7%, lung diseases (5.2%), AIDS 3.6%, maternal causes accounted for 2.07% and 1.55% neoplasms. The rate of death between 30 and 49 years rose from 7.9% in 2005 to 81% in 2009.

**Conclusions** The most common causes of death were undetermined causes, cardiovascular events and violent death. It appears that prevention and health promotion carried out in health units could prevent such events.

**Introduction** Railway suicides are a suicidal behaviour which strongly impact psychological and socioeconomic aspects of the railway company, its employees and possible eye witnesses. The German Railway Suicide Prevention Project was carried out in 2002 aimed to prevent suicidal acts on German Railway net by a variety of measurements. The present study evaluated the impact of this project on the number of suicides during an observation period from 1998 to 2006.

**Methods** The data base of the present study is derived from the Event Database Safety (EDS), which is the national central registry of all person accidents in the context of the national German railway company covering the entire German railway track system excluding municipal subway providers. We compared the railroad suicide rate 4 years before and after starting the project by defining an “index group” (1998–2001) and a “control group” (2003–2006) using Poisson regression with estimating the average percentage change (APC).

**Results** The absolute number of suicidal events on the railway track system decreased from 1006 in 1998 to 724 in 2006. The mean suicide rate in the control years was 13.9% (95% CI 6.9 to 20.4) lower compared to the index years (p<0.001). Adjusting for the overall suicide rate attenuated the decline of the railway suicide rate (APC 4.8%, 95% CI 1.8 to 7.8) but significance remained (p=0.002).

**Conclusion** The present study revealed a favourable trend with decreasing railway suicide rates even taking the overall suicide rate into account. The preventative measurements carried out by the project might contribute to this development.

**P1-89** MILITARY POPULATIONS, MILITARY DISEASES: THE DEVELOPMENT OF MILITARY EPIDEMIOLOGY

doi:10.1136/jech.2011.142976c.82

1B Bergman,* 1Army Medical Directorate, Camberley, UK; 2Scottish Government, Edinburgh, UK

**Introduction** In the mid 19th century, military health protection began to be informed by epidemiology. This paper examines the development of military epidemiology and its impact on military health policy.

**Methods** Historical material drawn from military health reports and other sources is used to illustrate long-term trends and developments.

**Results** The science of military epidemiology can be traced back to the Scottish Enlightenment of the 18th century. At first qualitative and descriptive, the early nineteenth century saw the development of a more quantitative and analytical approach which became a powerful tool in influencing military policy to protect and improve the poor health of the Victorian soldier, who faced disease and environmental hazards far from home. Formal annual reports on the health of the Army, which were instituted in 1839 and continue to this day, have provided a unique picture of long-term health trends in a changing population. Over time, both the nature of the disease threat and the means of health protection changed, and examples will be given of trends in disease and their impact on military operational effectiveness. The military population itself also
changed as recruits became better nourished and healthier. Modern technology has updated the methodology for data collection, although not necessarily beneficial.

**Conclusion** Although the military population, its health problems and the methods of data collection have changed over time, the fundamental principle of basing military health protection on sound epidemiology remains constant. The lessons of the past provide evidence on which future planning can be based.

**P1-90** SOCIAL INEQUALITIES IN HEALTH AMONG ELDERLY IN A BRAZILIAN SOUTHEASTERN CITY
doi:10.1136/jech.2011.142976c.83

1M B de Azevedo Barros,* 1P M B Francisco, 1M G Lima, 2C L G Cesar. 1State University of Campinas Medical School, Campinas, São Paulo, Brazil; 2University of São Paulo, Faculty of Public Health, São Paulo, Brazil

**Introduction** Social inequalities in health is an important problem in Brazil challenging the public health System. This is also an issue that affects the elderly population.

**Objective** The aim of this study was to assess the magnitude of social inequalities in health status, health behaviour and use of health services in elderly.

**Methods** A population-based cross-sectional study was carried out in 2008 e 2009 involving 1518 elderly residents of Campinas, SP, Brazil (ISACAMP 2008/2009). Social inequalities were assessed by educational level. Prevalence and adjusted prevalence ratios were estimated applying Poisson multiple regression, using svy commands of stata11.

**Results** Significant social differences were found between the educational strata. Elderly individuals with a higher degree of schooling consume more alcoholic beverages (RP = 1.94), are less sedentary (RP = 0.72), have healthier dietary (1.64) and a lower prevalence of hypertension (RP = 0.80), diabetes (RP = 0.71), dizziness (RP = 0.67), headaches (RP = 0.52), back pain (RP = 0.77), visual impairment (RP = 0.57) and denture use (RP = 0.68). But, there were no differences in the use of health services in the previous 2 weeks, in hospitalisation or in surgeries in the previous year and in medicine intake in the previous 3 days. Among elderly with hypertension or diabetes, there were also no differences in the regular use of health services and medication.

**Conclusion** The results showed strong social inequality in this elderly population with significant differences in several health indicators, along with equity in the access of some health service components, suggesting positive effects of the Brazilian Public Health System on promoting health equity.

**P1-91** PREVALENCE AND TEMPORAL TRENDS IN THE PREVALENCE OF SMALL INTESTINAL ATRESIA IN EUROPE: A MULTILEVEL ANALYSIS
doi:10.1136/jech.2011.142976c.84

1E Best,* 1P W G Tennant, 1J Rankin, 2Eurocat Working Group. 1Newcastle University, Newcastle upon Tyne, UK; 2Regional Maternity Survey Office, Newcastle upon Tyne, UK; 3University of Ulster, Belfast, UK

**Introduction** Small intestinal atresia (SIA) is a congenital anomaly characterised by the abnormal closure, discontinuity or narrowing of the duodenum, jejunum or ileum. This study used multilevel regression to examine the total prevalence and temporal trends in the prevalence of SIA in Europe.

**Methods** Cases of SIA delivered during 1990–2006 and notified to 21 European congenital anomaly registers formed this population-based case series. Total prevalence and changes in prevalence over time were modelled using multilevel Poisson regression. Heterogeneity between registers was evaluated from the intercept’s random component. Inter-regional differences in trends were examined by including random slopes.

**Results** 1154 SIA cases were reported among 5,383,099 registered births. Of 1092 singleton cases, 222 (20.3%) were associated with chromosomal and 227 (20.8%) with structural anomalies. The prevalence per 10,000 births for singleton cases of normal karyotype was 1.6 (95% CI 1.5 to 1.7) for SIA, 0.9 (95% CI 0.8 to 1.0) for duodenal atresia and 0.8 (95% CI 0.7 to 0.8) for JIA. There was no significant trend in SIA, duodenal atresia or JIA prevalence over time (RR = 1.0, 95% credible interval (CrI): 1.0 to 1.0, for each) but SIA and duodenal atresia prevalence varied significantly between participating registers (p = 0.03 and p = 0.04, respectively). There was no increased risk of SIA in mothers aged <20 years compared to mothers aged 20 to 29 (RR = 1.3, 95% CrI: 1.0 to 1.3; p = 0.08).

**Conclusion** This study found no evidence of a temporal trend in the prevalence of SIA, duodenal atresia or JIA although SIA and duodenal atresia rates varied between geographic areas.

**P1-92** AN EPIDEMIOLOGICAL STUDY OF TUBERCULOSIS PATIENTS WITH RISK PATTERN OF HIV/AIDS AMONG UNDERPRIVILEGED POPULATION IN NORTH INDIA
doi:10.1136/jech.2011.142976c.85

V Bhatia, *S Puri, M Thakare. Government Medical College, Sector 32, Chandigarh, India

**Introduction** Tuberculosis is a major cause of morbidity and mortality in developing countries. National AIDS Control Organization, India has reported TB as the commonest opportunistic infection (62.3%) among HIV infected persons.

**Methodology** The study was conducted among 155 patients of tuberculosis at three Microcopy centres attending urban and rural health centres with the objectives of studying epidemiological profile of patients and to assess HIV-AIDS pattern and high risk behaviour. Information on pre-designed format related to socio-demographic clinical profile, categorisation, treatment and awareness about HIV-AIDS, mode of transmission and behaviour was gathered in 2009.

**Results** Maximum number of patients were in the age group of 21–50 yrs (23.22%). 41.95% being illiterate. 42.58% were having a monthly family income of under Rs. 3000/- (US$ 67). 47.74% had migrated from another poor state, 70.32% married. 11.72% TB patients were staying with under-six children. Fever (79.35%) and cough (72.25%) were presenting symptoms at starting the treatment. 54.19% belonged to category 1 of DOTS. Only half (54.19%) were aware of HIV-AIDS—77.35% in rural and 42.15% in urban areas. History of multiple partners could be elicited from two cases in urban settings. History of blood transfusion was given by 7 (4.51%), 18 (11.61%) of TB were tested for HIV. 77.35% from rural and 25.32% from urban areas (total 21.93%) desired to know their HIV status.

**Conclusion** Maximum numbers of TB cases were in young age group, males, low socio-economic status particularly in urban slums with poor awareness level about HIV/AIDS. Coordinated efforts for implementation of the two programs for such population groups are required in controlling these diseases.

**P1-93** TRENDS IN THE BURDEN OF CARDIOVASCULAR DISEASES IN THE UK, 1961 TO 2011
doi:10.1136/jech.2011.142976c.86

**Introduction** Mortality from cardiovascular disease (CVD) has dramatically reduced over the past 50 years in the UK. While this trend should be celebrated, it is important to consider mortality alongside trends in morbidity to gain a full understanding of how healthcare resources and prevention schemes should be directed.
