The effects of caring for young disabled children on mothers’ health and healthcare use: findings from the Born in Bradford cohort study

Rationale Mothers of older disabled children have worse health than mothers of typically developing children but may visit the GP less about their health problems. It is unknown whether these disparities are also present during the preschool period (0–5 years). This study compared the prevalence and frequency of GP visits for symptoms of maternal ill-health in mothers of preschool children with developmental disabilities compared with other mothers.

Methods The primary care records of children in the Born in Bradford cohort study were searched for developmental disability diagnoses before the age of five. Mothers of these children were considered exposed (n=477); all other mothers unexposed (n=9,250). Bivariate and multivariate logistic regression reporting odds ratios (OR) was used to compare the prevalence of psychological distress, head and musculoskeletal (MSK) pain, and exhaustion for exposed versus unexposed mothers in the year prior and five years after the child’s birth. Bivariate and multivariate zero-inflated negative binomial regression reporting relative rate ratios (RRR) was used to compare GP visit frequency for these symptoms. Covariates were mother’s age, ethnicity, education, subjective financial status, cohabitation status and pre-natal data (in the post-natal models).

Results Prevalence varied little pre-birth. Exposed mothers were more likely than unexposed mothers to have post-natal psychological distress (34.6% exposed versus 30.2% unexposed; OR 1.23; 95% CI 1.00, 1.52) and exhaustion (19.3% versus 14.4%; 1.11, 1.78) after the child’s birth, but not head and MSK pain (43.4% versus 39.1%; 1.17; 0.96,1.42). Adjusting for covariates did not attenuate these findings. Visit frequency also varied little pre-birth. Visits to the GP increased after the birth, and exposed mothers did not consult more frequently than unexposed: psychological distress (mean 1.1 (standard deviation 2.0) exposed versus 0.9 (2.3) unexposed; RRR 1.00; 95% confidence interval 0.83, 1.20); head and MSK pain (1.0 (1.7) versus 0.9 (1.7); 1.08; 0.83, 1.40); exhaustion (0.3 (0.6) versus 0.2 (0.5); 1.19; 0.76, 1.85). Pakistani ethnicity (versus white British) and pre-natal consultation were strongly associated with higher post-natal consultation rates.

Conclusion Mothers of young children with developmental disabilities may have an increased risk of some symptoms of ill health, but do not consult more frequently. The provision of early family-centred support and increased GP awareness of caregiver status could help identify and support those at risk.
assess other important obstetric outcomes, e.g. hypertensive disorders of pregnancy.

### INTRODUCTION

**RF18**  
**CONTRIBUTION OF SEVERE NEONATAL MORBIDITY TO NEURODEVELOPMENT AT 2 YEARS OF AGE AMONG VERY PRETERM INFANTS: A MEDIATION ANALYSIS**

3. Department of Health Sciences, Leicester University, Leicester, UK.  
4. Children’s Hospital, Marburg University, Marburg, Germany.  
5. Clinical Care and Management Innovation Research Area, Bambino Gesù Children’s Hospital, Rome, Italy

**Background** Low gestational age (GA) is the principle risk factor for poor long-term neurodevelopment among very preterm (VPT) children. Some of this effect results from a greater vulnerability to severe neonatal morbidities (SNM) which are strongly related to low GA as well as to poor neurodevelopmental outcome. We aimed to investigate how SNM mediates the relationship between GA and VPT adverse neurodevelopmental outcome at 2 years of corrected age.

**Methods** Data come from the area-based Effective Perinatal Intensive Care in Europe (EPICE) cohort of children born below 32 weeks’ GA in 2011/2012 in 11 European countries. Perinatal data were abstracted from medical records and follow-up was conducted using parent questionnaires at 2 years of corrected age. Children unable to walk without assistance or aids, or sit or hold their head up without support were classified with severe gross motor impairment (GMI). Non-verbal cognitive impairment (NVCI) and language impairment (LI) was defined as an expressive vocabulary of less than 10 words. SNM was defined as one or more of the following morbidities: intraventricular hemorrhage grades III & IV, cystic periventricular leukomalacia, retinopathy of prematurity stages III-V, surgical necrotizing enterocolitis or broncho-pulmonary dysplasia. An inverse odds weighting (IOW) mediation analysis was used to estimate the total effects of GA, and estimated indirect effects operating through SNM or directly through GA or CI were estimated by bootstrapping. Co-variables included perinatal risk factors and family socioeconomic characteristics.

**Results** Of 3370 children assessed in the follow-up; 5.3% had GMIs also NVCI and 9.4% had LI. A one-week increase in GA was associated with a decreased risk of GMI (OR=0.80; 95 CI% 0.74–0.86), of NVCI (OR=0.85; 95 CI% 0.81–0.89) and LI (OR=0.89; 95 CI% 0.83–0.96). 20.4% of infants had at least one severe morbidity and this was more common among children with GMI (66.0% vs. 18.4%), NVCI (38.8% vs. 17.2%) and LI (38.4% vs. 18.4%). For GMI, almost 100% of the total effect of GA on GMI was mediated by SNM. This proportion was 70% for NVCI and 40% for LI.

**Conclusion** Reducing SNM could lead to substantial improvements in neurodevelopmental outcomes for VPT children, especially those related to motor development.

### INTERVENTIONS & STAKEHOLDERS’ PERSPECTIVES

**RF19**  
**IDEOLOGY, STAKEHOLDERS AND PUBLIC HEALTH POLICY: A COMPARISON OF MEDIA DISCOURSES ON ALCOHOL AND SUGAR PRICING POLICY IN THE UK**

3. Ferguson, G.  
4. Buckton, C.H.  
5. Lefeld, P.  
6. MRC/CSO Social and Public Health Sciences Unit, University of Glasgow, Glasgow, UK.  
7. School of Social and Political Sciences, University of Glasgow, Glasgow, UK

**Background** The media are a key influence on public and policymakers’ perceptions of the need for, and acceptability of, new policies to improve population health. In the case of Minimum Unit Pricing (MUP) for alcohol and the Soft Drinks Industry Levy (SDIL), previous analysis suggests that an actor’s position in the network is linked to their ideology, for example using social vs market justice arguments. In this study we use ideological scaling to examine stakeholders’ policy positioning further.

**Methods** Data sets were generated from public debates on MUP and SDIL in UK newspapers using content analysis and discourse network analysis. Actor statements were analysed using ideological scaling of ideal points in Item Response Theory models. This approach is based on the assumption that actors communicate their ideological position through verbal statements in public documents. These statements then provide the basis to estimate underlying ideological positions of actors in specific policy areas. Ideological positions were estimated using Markov Chain Monte Carlo in the Bayesian Ideal Point model of Martin and Quinn.

**Results** In both debates, health charity and advocacy groups, individual NHS organisations and professional associations, as well as government advisory bodies, had a clear policy supporting ideology. Contrary to this, manufacturers/associates and industries and associations, as well as think tanks and research analysts, had an opposing ideology. For the policy opponents, the most discriminating policy concepts were mainly economic or political in nature (e.g., ‘Policy is illegal’, ‘Policy will damage industry and associated industries’, ‘Government action on commodity consumption is nanny statis’ or ‘Policy will damage the wider economy’). For the policy proponents, the most discriminatory policy concepts related to public health issues (‘Policy will reduce consumption of commodity’, ‘Policy needed to address commodity problem’, ‘Policy will improve population health’).

**Conclusion** The media are a key influence on public and policymakers’ perceptions of the need for, and acceptability of, new policies to improve population health. In contested public policy debates, stakeholders on both sides of the argument put forward competing rhetoric via the media to support their position in line with their vested interests whether driven by market and social justice principles.
