frequency in the past four weeks respectively, at baseline. Calculating change scores over time, we assessed whether changes in social media belonging, were associated with changes in drinking status, and whether changes in frequency of use of social media sites were related to changes in drinking frequency, using multinomial logistic and linear regression model. Analyses were repeated with number of times binge drinking (5+ drinks) in the past four weeks, on a sub-sample of participants aged 16–19. Models adjusted for sex, age, household tenure, urban/rural area, educational/work status, baseline social media use/frequency and number of friends.

Results At baseline, those who belonged to a social media site were over four times more likely (OR=4.62 95% CI (3.61–5.91)) to be a drinker versus non-drinker. Those who chatted for longer on social media sites were more likely to have drank at least once a week compared with not drinking in the past month (none vs. 1–3 hours (2.31 (1.45–3.68), 4–6 hours 2.60 (1.44–4.72), 7 hours or more 5.92 (2.86–12.28)). Among participants aged 16–19, a similar gradient was found with higher odds of binge drinking three or more times in the past month, with greater chat frequency (e.g. no hours chatting vs. 7 hours or more 6.29 (2.50–15.82)).

Over time, becoming new social media users increased the odds of becoming a new drinker (1.77 (1.04–3.03)) versus no change in drinking status. Participants who became more frequent users of social media sites, were more likely to drink more frequently (β=0.13, 95% CI (0.09–0.17)), and binge drink (β=0.21, 95% CI (0.12–0.31)) more frequently across waves.

Conclusion Increasing social media use was associated with greater alcohol consumption; mechanisms behind this relationship should be investigated. Alcohol-related content on the internet should be monitored.

TACKLING LOCAL ALCOHOL-RELATED HARMs IN THE NIGHT TIME ECONOMY: A PROCESS EVALUATION WITH A COMPLEX SYSTEMS PERSPECTIVE

1ET McGill*, 2D Marks, 3M Petticrew, 4M Egan. 1Department of Health Services, Research and Policy, London School of Hygiene and Tropical Medicine, London, UK; 2Department of Public Health, Environments and Society, London School of Hygiene and Tropical Medicine, London, UK

Background English local authorities (LAs) have certain powers they can utilise to help them tackle alcohol-related harms. One such power is the Late Night Levy (LNL) which uses a ‘polluter pays’ principle whereby the LA charges alcohol retailers a fee for selling alcohol after midnight. Public health evaluators are increasingly considering how concepts from complexity science and systems thinking might shed light on how interventions can affect health in complex, real world settings such as local alcohol systems. This study aims to explore how the LNL acts as an event within the alcohol system, with a particular emphasis on understanding how the intervention, actors and the system as a whole adapt and co-evolve in response.

Methods We conducted a process evaluation, using a complex systems perspective, in one LA. We included a range of system actors and utilised qualitative data generation methods. We interviewed LNL implementers and alcohol consumers (n=21), conducted observations in pubs and during community-safety patrols (34.5 hours) and reviewed documents on the LNL and the broader system (n=15). We conducted a deductive thematic analysis, applying concepts from systems thinking and complexity science to: 1) describe the system into which the LNL is introduced; and 2) identify emergent system outcomes.

Results The LNL operates within a complex system consisting of diverse actors with competing goals; these include the local political system and statutory functions, the retail sector, the third sector, residents and users of the nighttime economy. Early analyses identified a number of system responses stemming from the intervention, which include: 1) retailer adaptation to the levy; 2) new and evolving relationships between retailers, the police, community-safety officers and LA officers; 3) changes in venue management; and 4) the evolution of the intervention itself in response to broader system feedback. These adaptations are hypothesised to affect alcohol-related health and social harms. However, the intervention also interacts with wider system influences on public health, for example local government budgetary constraints during a period of central government cuts.

Discussion Conceptualising the LNL as an event within a complex system allows us to analyse its trajectory as it embeds within, and influences the broader system in which it is located. Further fieldwork and analyses are ongoing and focus on sampling additional system actors and exploring the influence of the vertical systems (e.g. national policy) which shape local responses to alcohol-related harms.

HEALTH-JUSTICE PARTNERSHIPS: A SYSTEMATIC SCOPING REVIEW OF INTERNATIONAL EVIDENCE ON IMPACT

1S Beardon*, 2C Woodhead, 3S Cooper, 4H Genn, 1R Raine. 1Department for Applied Health Research, University College London, London, UK; 2Department of Psychological Medicine, King’s College London, London, UK; 3Faculty of Laws, University College London, London, UK

Background Social welfare legal problems impact negatively on mental and physical health. These include issues with welfare benefits, debt, homelessness, family and employment. Services providing legal assistance have developed collaborations with healthcare across the UK and the globe. These ‘health-justice partnerships’ aim to support health of the most disadvantaged groups, tackling interconnected challenges of health inequalities and access to justice. International evidence on the impacts of these partnerships has never previously been reviewed. This study interrogates the state of current evidence and provides new insights from international practice.

Methods A systematic scoping review of international literature was undertaken. Both academic and grey literature was included from OECD countries, 1995–2018. The review
aimed to describe different service models and summarize evidence on impacts. Data from included publications were extracted and analysed narratively. Quality of included publications was assessed. Evidence on impact is presented according to each service objective.

**Results** Health-justice partnerships were diverse in their characteristics. Target populations focused on low income, vulnerable or underserved groups. Approaches to service coordination included co-location, referral, or integration of legal advisors into care teams and care pathways. The strongest evidence on impact was for increased access to legal assistance and improvements in individuals' financial and social circumstances. Despite this role in addressing social determinants of health, evidence was lacking on the wider issues of prevention and health inequalities. There was strong qualitative evidence for improvements in mental wellbeing, reflected in some quantitative research. Studies suggested positive outcomes in supporting healthcare professionals and contributing to high quality patient care, although findings on healthcare utilisation and costs were mixed.

**Discussion** This is the first international review on the delivery of health-justice partnerships, bringing together evidence from across the world to map current knowledge on service models and impacts. Integration of health and legal services aligns with policy priorities in both sectors, addressing social welfare legal issues which are leading causes of inequality and underlying determinants of poor health. The evidence supports health-justice partnerships as a means of improving access to justice for vulnerable groups and alleviating health-harming legal needs. Some key service objectives require a stronger knowledge base, while others remain un-evidenced. Cross-sector alignment and collaboration presents challenges, and further research is needed on successful delivery of integrated services. This review has informed a primary research study exploring implementation of health-justice partnerships in different settings across England to inform future policy and practice.

**P92 A MATCHED ANALYSIS OF THE IMPACT HAVING A CARER HAS ON AN INDIVIDUAL’S HEALTH AND SOCIAL CARE UTILISATION ACROSS FIVE SETTINGS OF CARE FOR ADULT RESIDENTS OF BARKING AND DAGENHAM**

1) Shand*, 1M Gomes, 1S Morris. 1Department of Applied Health Research, UCL, London, UK; 1Department of Public Health and Primary Care, University of Cambridge, Cambridge, UK

**Background** Across the UK today, an estimated 6.8 million people are carers, supporting friends and family who are older, disabled or seriously ill. The economic value of informal carers contributions is an estimated £132 billion a year. This is calculated by multiplying the total hours of care provided by carers (using responses from the ‘Personal Social Services Survey of Adult Carers in England 2014–15’ to determine numbers of carers and average hours of care provided) by the unit cost of an hour of replacement homecare for an adult (£17.20). This assumes informal carers provide substitution for formal care. Reliance on carers appears to be increasing, with fewer people getting access to formal support as a result of local authority budget cuts.

This study aimed to understand if people with a carer have different levels of service use across different settings of care when compared to those who do not have a carer but have similar characteristics.

**Methods** A quantitative study using person-level data in Barking and Dagenham (B&D), a London borough, to assess the impact of having a carer in terms of the differences in cost-weighted utilisation relative to a matched control group. Nearest neighbour matching was used, matching on age,
