Further code lists used to derive the Secure Anonymised Information Linkage databank Dementia electronic Cohort (SAIL-DeC) are available at: <https://datashare.is.ed.ac.uk/handle/10283/3268>.

The construction of SAIL-DeC is outlined in Schnier C, Wilkinson T et al. *Cohort profile: The Secure Anonymised Information Linkage databank Dementia e-cohort (SAIL-DeC)*. International Journal of Population Data Science. 2020 Feb 25;5(1).

Supplementary Results: Medications predicted a priori to be associated with dementia (Group 1)

Neurodegenerative diseases

All drugs in the 'Drugs used in parkinsonism and related disorders' (BNF section 4.9) section were associated with dementia (HR range 2.86-8.55).

Cardiovascular diseases

Many medications prescribed for cardiovascular diseases were associated with dementia, across multiple BNF sections. This included drugs such as: digoxin (HR 1.67); diuretics, such as furosemide (HR 1.54) and spironolactone (HR 1.45), beta-adrenoreceptor blocking drugs, such as propranolol (HR 1.29); nitrates; anticoagulants such as warfarin (HR 1.34) and rivaroxaban (HR 2.08); antiplatelets, such as aspirin (HR 1.60), dipyridamole (HR 2.21) and clopidogrel (HR 1.70) and statins.

Diabetes

Almost all drugs for diabetes were associated or tentatively associated with an increased dementia incidence. Most of the medications that were not associated had similar hazard ratios, but with small numbers of cases exposed.

Depression

Lithium (BNF section 4.2 - Drugs used in psychoses and related disorders) was associated with dementia with a large effect size (HR 3.59).

Among antidepressants (BNF section 4.3 - Antidepressant drugs), paroxetine, venlafaxine, citalopram, reboxetine, mirtazapine and escitalopram were all associated with dementia (HR range 1.61-2.95) with nefazodone tentatively associated (HR 1.73). Other drugs in this section had similar HRs, but with small numbers of cases exposed.

Symptoms of complications of dementia

All drugs in the section 'Drugs used in psychoses and related disorders' (BNF section 4.2) were associated with dementia, with large effect sizes (HR range 2.95-7.32), except for levomepromazine (also used as an antiemetic), which had few cases exposed (HR 1.91).

Many medications under sections such as 'fluids and electrolytes', 'oral nutrition', 'minerals' and 'vitamins' were associated with dementia. Of note, thiamine and 'vitamin B complex', often prescribed in alcohol-dependence syndrome, had very large hazard ratios (HR 5.64 and 2.94 respectively).
