Transmission of SARS-CoV-2 into and within
immigrant households. Nation-wide registry-study
from Norway.

By Methi et al., 2021.

S-Table 1: Regression table by immigrant definition.

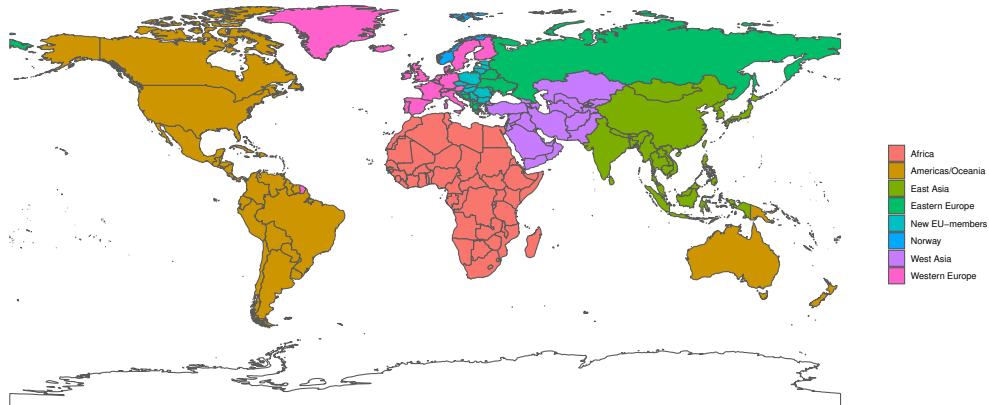

In this regression we include use different definitions of "immigrant households". In model 1, an immigrant household is defined as at least one person in the household being born abroad. This is the definition used throughout the paper. In model 2, a household is defined as an immigrant household if 50% or more of the household is born abroad. In model 3 we compare these two definitions with the first definition as the baseline.

	(1) Immigrant: 1 or more	(2) Immigrant: 50% or more	(3) (1) vs (2)

In model (1) immigrants are defined as at least one member being born abroad. Model (2) if 50% or more are born abroad, and model (3) compares these immigrants definitions with the first model being baseline.

S-Figure 1: Map of regions

Note: Number of household-members included in the study: Africa (107,600), Americas/Oceania (85,245), East Asia (168,943), Eastern Europe (73,209), New EU-members (166,461), Norway (3,065,877), West Asia (152,826), and Western Europe (243,377). French Guyana is included in Americas/Oceania despite the pink color.

S-Figure 2: Households with secondary transmission

S-Table 2: Regression table with coindexes.

In addition to the 27,730 households with one index persons, 3,411 households contain multiple index persons. These have been excluded in the main analyses. In this regression analysis we included them. In order to do so, we perform a random draw of the index person and remove the other index person(s) from the sample. Households containing two persons only, where both were indexes, were excluded (n = 869), leaving us with 2,542 extra households and 7,803 persons.
